

10 Dietary Fibre

**Daily recommended fibre intake
for adults is 25-30g**

Types Of Fibre

SOLUBLE FIBRE

- Soluble fibre breaks down in the body and becomes gel-like material.
- Soluble fibre slows down the absorption of cholesterol and sugar into the bloodstream
- It also keeps digested food moving smoothly through the GI tract
- Oats, barley, peas, avocados, fruits and beans contain soluble fibre

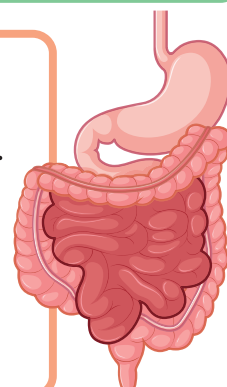

INSOLUBLE FIBRE

- Insoluble fibre stays in a fibrous form and helps food pass through the digestive system
- Insoluble fibre is not broken down in the body
- Fruits, vegetables, whole grains and nuts contain insoluble fibre

Fibre Digestion

Fibre is referred to as a type of carbohydrate that cannot be digested. It is important to keep the digestive tract working smoothly. Since we do not digest it, fibre in food passes into the intestine and absorbs water. The undigested fibre creates bulk so the intestinal muscles can push waste out of the body. Eating enough fibre helps to prevent constipation.

Dietary Fibre

- **Soluble fibre** - This fibre absorbs water like a sponge and thus softens the stool and helps the waste material to move through the body more quickly.
 - dissolves in water to form a gel-like material.
 - can help to lower blood cholesterol and glucose level.
 - found in oats, peas, beans, apples, citrus fruits, carrots, barley and psyllium.
- **Insoluble fibre** - This bulky fibre acts as a scrub brush, pushing food along the colon so that constipation cannot occur.
 - promotes the movement of material through our digestive system and increases stool bulk.
 - prevents constipation or irregular stools.
 - Found in whole-wheat flour, wheat bran, nuts, beans, and vegetables (cauliflower, green beans and potatoes)

Eat a variety of high fibre food to receive both soluble and insoluble fiber.

Benefits of high fibre diet:

- Normalises bowel movements
- Helps to maintain bowel health
- Lowers blood cholesterol
- Helps to control blood sugar levels
- Aids in achieving healthy weight

Daily recommended fibre intake for adults is 25-30g.

Tips for fitting in more fibre :

- Jump-start your day with a high-fibre breakfast or shake (added with 'Mixed Fibers')
- Switch to whole grains (low GI food)
- May consume legumes (beans, peas, lentils and kidney beans)
- Eat more fruits and vegetables

**MAINTAIN A
BALANCED DIET**

**MAINTAIN
PERSONAL
HYGIENE**

**ENOUGH
REST**

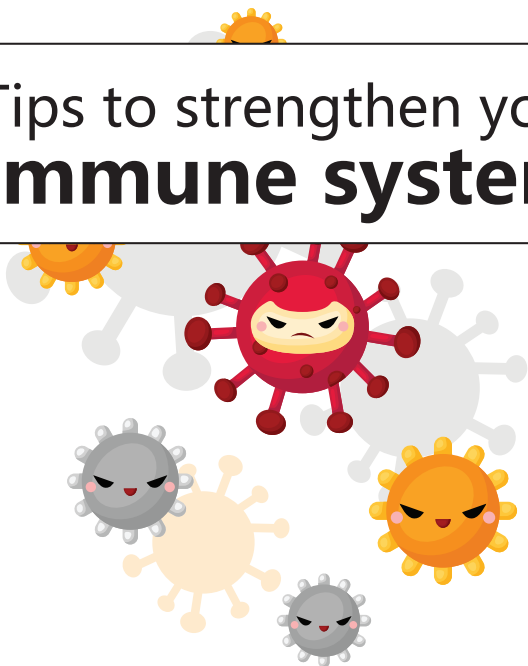

**REGULAR
EXERCISE**

**STAY
HYDRATED**

Tips to strengthen your
immune system.

Immunity Health

1. The immune system is a complex network of cells and proteins that defends the body against bacterial and viral infections.
2. Several diet and lifestyle changes may strengthen your body's natural defenses and help you fight against harmful pathogens or disease-causing organisms.
3. **Tips to strengthen your immunity:**
 - i. **Maintain a balanced diet-**
All nutrients.
 - ii. **Maintain personal hygiene-**
Practice good hygiene habits. Wash your hands frequently for at least 20 seconds. Make sure to get to palms, back of hands, under fingernails and wrists.
 - iii. **Enough rest-**
Aim for 7-8 hours per night to allow your body to recover from stress and exercise.
 - iv. **Regular exercise-**
Engage in moderate-intensity exercise 3 times a week for at least 30 minutes can help to boost your immune system.
 - v. **Stay hydrated-**
3-4 litres of water intake per day is recommended.

12 Mobility And Flexibility

Muscles, bones and joints support the mobility and flexibility of our body.

Do you know?

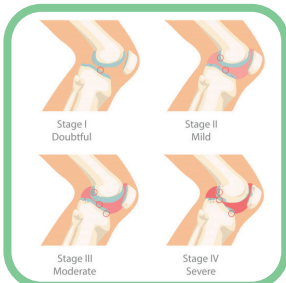

MUSCLE

- After 30 y.o., -> muscle mass starts to decline 3-8% per decade
- For those with active lifestyle, working out on the same muscle group for 2 days consecutively-> tissue breakdown instead of building

BONE

- Bone mass starts to decline as we reach 30 y.o. -> risk of fractures increases and may lead to osteoporosis
- The most common osteoporosis-related fractures- spine, wrist, hip-> reduction in height, intense back pain and deformity, loss of independence

JOINT

- Overweight or obese, elderly -> speeds up cartilage breakdown -> joints become inflamed, pain, stiff
- Incorrect posture during movements and exercise -> increases risk of knee pain and injuries

Key Tips To Maintain Mobility and Flexibility :

**GOOD
NUTRITION**

**WEIGHT
MANAGEMENT**

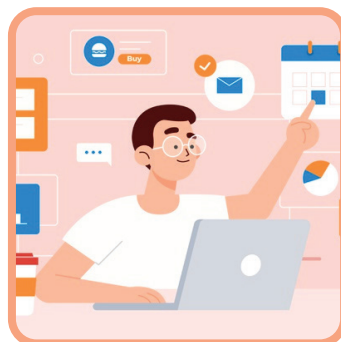

**PHYSICAL
ACTIVITIES**

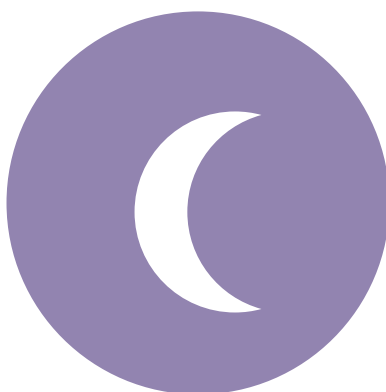

Mobility And Flexibility

1. Muscles, bones and joints support the mobility and flexibility of our body.
2. Muscle loss begins as early as 30 years old in which adults then start losing 3-8% of their muscle mass per decade and it can be more prominent from the age of 50 onwards. This will cause our muscles to shrink and lose mass. A sedentary lifestyle can further accelerate this condition.
3. As for those who have active lifestyle, working on the same muscle group for 2 days consecutively may lead to tissue breakdown instead of building as our muscles need about 24-48 hours to repair and rebuild. Rest and recovery is an essential part of workout routine for muscle and tissue repair and remember to consume high quality protein within 30 minutes to 1 hour post-workout to allow the repair and recovery process to happen.
4. Bone mass peaks at around the age of 30 and begins to decline gradually as we reach 40 especially in women after menopause. The decline in bone mass that is common in elderly makes bones weaker which then increase the risk of fractures and may lead to osteoporosis.
5. The most common fractures associated with osteoporosis occur at the hip, spine and wrist. The likelihood of these fractures occurring, particularly at the hip and spine, increases with age in both women and men. These fractures may cause reduction in height, intense back pain and deformity as well as loss of independence.
6. For those who are overweight or obese and in elderly, their joints become more vulnerable to damages as it speeds up the degradation of cartilage. This may cause joints to suffer from arthritic conditions such as inflammation, stiffness and pain making physical activities difficult.
7. During movements and exercises, incorrect posture may increase likelihood of knee pain and injuries.
8. Eating daily meals with good nutrition especially lean protein, fruits, vegetables and calcium, magnesium and vitamin D impacts a good musculoskeletal health.
9. Weight management is also an effective way to reduce the burden on our joints, bones and muscles. All those aches and pains in your knees are probably due to the extra weight that you are carrying around.
10. Physical activities such as weight-bearing exercises can help to maintain muscle mass and strength. Stretching can also help to maintain joint flexibility to promote balance and avoid falls or injuries.

Dementia is a syndrome in which there is deterioration in:

**MEMORY****THINKING****BEHAVIOUR****ABILITY**

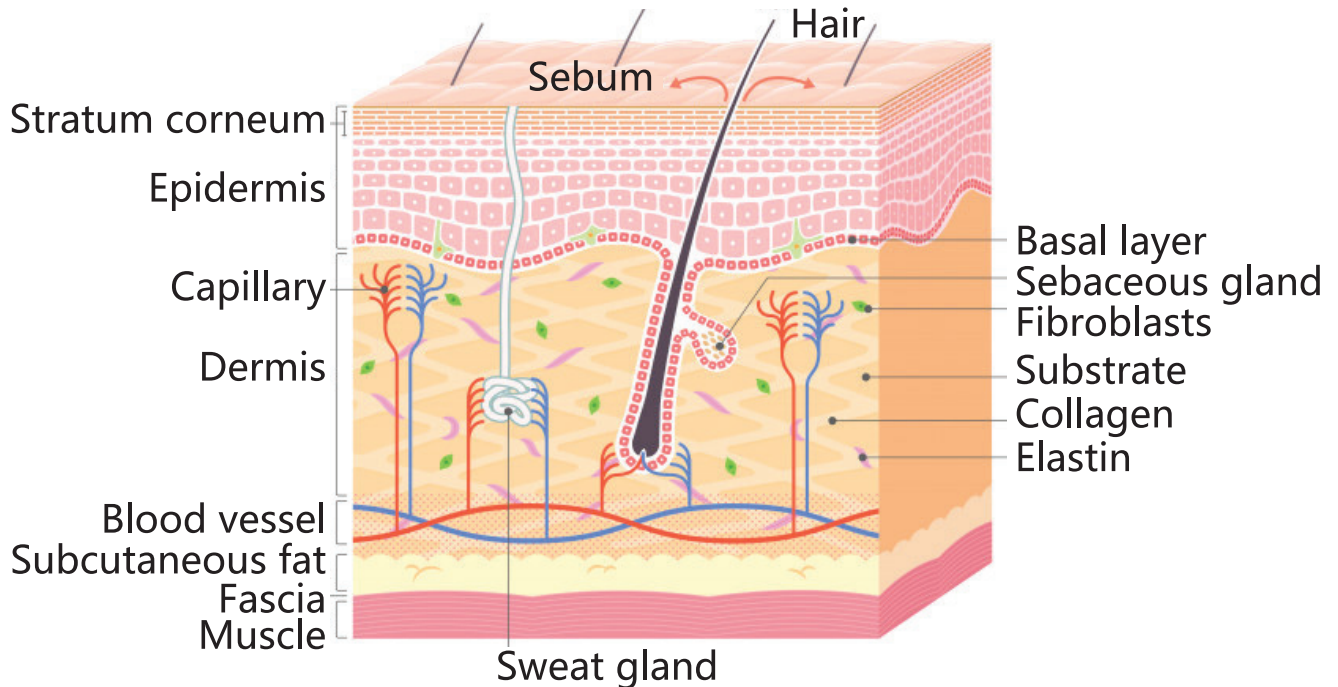

The 6 pillars of healthy brain:

**PHYSICAL
EXERCISE****SOCIAL
INTERACTION****FOOD &
NUTRITION****AVOID METABOLIC
SYNDROME****SLEEP &
RELAXATION****MENTAL
FITNESS**

Healthy Body Healthy Brain

1. (Customer' s Name), have you experienced misplacing keys, blanked on some-one' s name, or forgotten a phone number before?
2. When you are young, you do not tend to pay much attention to these lapses, but as you grow older, you may worry about what they mean.
3. Age-related memory changes are not the same thing as dementia.
4. Dementia is a syndrome in which there is deterioration in:
 - i. **Memory** (gets lost even in familiar places)
 - ii. **Thinking** (difficulty with words & numbers, repeats phrases & stories in same conversation)
 - iii. **Behaviour** (behave in socially inappropriate ways, acting like a kid)
 - iv. **The ability to perform everyday activities** (difficulty in paying bills, unable to bathe & dress up appropriately)
5. Although dementia mainly affects older people, it is not a normal part of aging.
6. Worldwide, around 50 million people have dementia, and there are nearly 10 million new cases every year.
7. Alzheimer disease is the most common form of dementia and may contribute to 60–70% of cases.
8. Dementia is one of the major causes of disability and dependency among older people worldwide.
9. The good news is healthy habits promotes good brain health and reduces your risk of cognitive decline/ rate of memory loss.
10. **The 6 pillars of healthy brain:**
 - i. **Physical Exercise** – Exercise improves blood flow & memory. Aim for 30 mins of aerobic exercise 5 times a week
 - ii. **Social Interaction** - Spend time with family & friends engaging in stimulating conversation
 - iii. **Food & Nutrition** – Eat a variety of food comprising fruits, vegetables, whole grains and those containing omega-3 fatty acids
 - iv. **Avoid Metabolic Syndrome** –
Get your medical condition under control. Diabetes, obesity, depression, high cholesterol increase risk of Dementia.
 - v. **Sleep & Relaxation** – 8 hours of sleep a day, engage in daily relaxation activities, such as meditation or breathing exercises
 - vi. **Mental Fitness** - Exercise your brain, learn something new, play strategy games, memory training or do puzzles to keep the brain active.

Structure of the skin

Factors Affecting Skin

DEHYDRATION

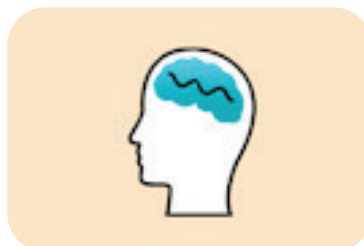

**IMBALANCED
DIET**

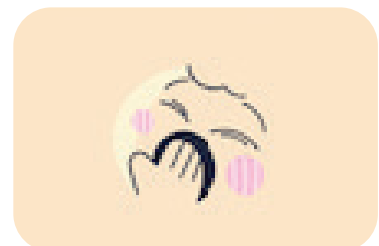

PHOTOAGING

**SMOKING
/ALCOHOL**

STRESS

**INADEQUATE
SLEEP**

Skin Health

Skin is the largest organ in the body weighing 2kg on average.

Skin Function:

- i. First line of defence between body and outside world, protects us from bacteria, viruses, pollution and chemical substances
- ii. Regulates body temperature
- iii. Maintains fluid balance and controls moisture loss
- iv. Acts as a barrier and shock absorber, recognises pain sensation to alert us to danger
- v. Protects us against sun's harmful UV rays

Factors affecting skin:

- i. **Dehydration** - Reduce caffeine intake and drink adequate water. Hydrate your skin daily with aloe vera, especially after showering.
- ii. **Imbalanced diet** - Consume essential dietary nutrients.
- iii. **Photoaging** - Protect skin from UV rays by applying sunscreen.
- iv. **Smoking/Alcohol** - Quit smoking and limit alcohol intake.
- v. **Stress** - Find your preferred way of reducing stress such as exercise 3-4 times a week, yoga or deep breathing exercise.
- vi. **Inadequate Sleep** - Sleep enables your body to repair and regenerate skin cells during sleep.

15 Phytonutrients

Eat a Rainbow!

Fill up half of your plate with fruits and vegetables.

5 Colours of Phytonutrients

8 out of 10 peoples do not eat enough colours

74% Don't Eat Enough RED

Red Benefits :

Supports prostate, urinary tract and DNA health. Protects against cancer and heart diseases

80% Don't Eat Enough YELLOW/ORANGE

Orange Benefits :

Good for eye, immune function, healthy growth and development

69% Don't Eat Enough GREEN

Green Benefits :

Supports eye health, arterial function, lung health, liver function and cells health. Helps wound healing and gum health

76% Don't Eat Enough PURPLE / BLUE

Purple / Blue Benefits :

Good for heart, brain, bones, arteries and cognitive health. Fights cancer and supports healthy aging

83% Don't Eat Enough WHITE

White Benefits :

Supports healthy bones, blood circulatory system and arterial function. Fights heart diseases and cancer

Your Goals : Eat 2 foods from each colour group daily!

Phytonutrients

1. A rainbow colourful of fruits and vegetables.
2. Phytonutrients are nutrients found in plants (fruits, vegetables, beans, grains).
3. Why do we need to eat 5 servings (400g) of fruits and vegetables daily?
It is because fruits and vegetables help to optimise our health in terms of:
 - i. Supporting our immunity.
 - ii. Increasing energy levels.
 - iii. Enhancing quality of life.

Why Phytonutrients

PHYTO : Greek work for “Plant”

NUTRIENTS : “Nutrients” are life enabling substances

Phytonutrients = Plant-Based Nutrients

Each vibrant colour is related to a range of health benefits.

Red Fruits & Vegetables – Promote Heart Health

Orange Fruits & Vegetables – Promote Eye Health

Green Fruits & Vegetables – Promote Cellular Health

Purple/Blue Fruits & Vegetables – Promote Brain Health

White Fruits & Vegetables – Promote Bone and Joint Health

That is why it is essential to eat the right amount and variety of fruits and vegetables.
