Nutrient Dense

100 calories nutrient dense food

1 Medium Size Apple
(190gram)

Strawberry x 8
(312gram)

Broccoli
(277gram)

3/4 Cup Low Fat Milk
(200ml)

Cashew Nuts x 10
(18gram)

F1 Shake
3 Flat Scoops

Hard-Boiled Egg
(1 Whole+1 White)

1 Medium Size Sweet potato
(116gram)

Meal Plan

Breakfast > Tea Time > Lunch > Tea Time > Dinner

Nutrient Dense Food VS Calorie Dense Food

1. Nutrient-dense food
 - contain a low amount of energy, or calories, for their weight, but a high number of healthy nutrients.
 - Rich in vitamins, minerals, fibre, lean protein and healthy fats.
 - Avocados, beans and lentils, berries, brassicas, eggs, greens, nuts and seeds, oats, salmon, sweet potatoes etc
2. Calorie-dense food (Empty-calorie food)
 - Carry little or no nutritional value and typically high in other undesirable ingredients, such as sugar, high-fructose corn syrup and trans fats.
 - Usually categorised into 3 main groups
 - Sugar – soda, fruit drinks, baked goods, processed food and ice-cream.
 - Fat – cookies, cake, chips, pizza and hot dogs.
 - Alcohol – beer and mixed drinks.
3. Optimising our diet
 - Eat a wide variety of nutrient-dense food
 - Stay away from empty calorie food

70% of our body is WATER!

Body water distribution

Brain	75% Water
Blood	83% Water
Heart	79% Water
Bones	22% Water
Muscles	75% Water
Liver	85% Water
Kidneys	83% Water

How do I drink more water?

Ways to drink water and stay hydrated

We are what we drink! Water makes up 60-70% of our body weight.

Water is vital

- a. for proper function of every cell, tissue, and organ in the body.
- b. for proper digestion and delivery of nutrients to your cells.
- c. to regulate body temperature.
- d. to nourish the brain and spinal cord.
- e. to cushion and lubricate joints.
- f. to help you manage your weight.

How much water should I drink?

Depends on: age, gender, size, physical activity level and climate

Recommendations timetable for drinking water :
drink more in the morning, drink medium in the afternoon, and
drink less at night

Generally, it is recommended that healthy adults drink 3-4 liters of water

Please ask your doctor for advice on kidney disease or special diseases related to water volume.

Beverages that contain calories are not counted in your daily water intake.

Be aware of dehydration symptoms

- | | |
|------------------------|----------------|
| i) Thirsty & Dry mouth | ii) Dark Urine |
| iii) Constipation | iv) Bad Breath |
| v) Muscle Fatigue | vi) Headaches |

Therefore, maintaining an adequate water intake is essential to avoid dehydration. By the time, thirst mechanism kicks in, you are already fairly dehydrated.

Unhealthy Cell VS Healthy Cell

100 MILLION
CELLS DIE PER MINUTE

SKIN CELLS - 28 DAYS

LIVER CELLS - 180 DAYS

INTESTINAL CELLS - 3 DAYS

RED BLOOD CELLS - 120 DAYS

WHITE BLOOD CELLS - A FEW HOURS

Importance of Cellular Nutrition

1. Why do we eat? ———Provide nutrition to our cells.
2. Healthy cells can achieve the process of "in" and "out " perfectly.
In ---> Promote nutrient absorption
Out ---> Accelerate the elimination of toxins
3. As shown in the diagram, unhealthy cell membranes are hard and dense, making it difficult for nutrients to be absorbed and toxins to be effectively excluded. Healthy cell membranes are soft and permeable, which can effectively obtain comprehensive and balanced nutrition
, so as to promote the repair, activation and regeneration of cells, so that they can reach the best functional state.
4. 100 million cells die every minute, including white blood cells (several hours), red blood cells (120 days), Small intestinal cells (3 days), liver cells (180 days) and skin cells (28 days).
5. Cell death is natural. The key is whether the raw materials required for repairing and replicating new cells are sufficient.
6. The seven essential nutrients for the human body are: protein, vitamins, minerals, carbohydrates, fats, fiber and water. People must take in these nutrients in a comprehensive, sufficient and balanced manner to be healthy.
7. What causing nutrients loss from cells?
 - i. Unreasonable eating habits:
Big fish and meat, overeating, fast food, late night snacks, junk food
 - ii. Nutrient losses during transportation and cooking:
Wash, cut, boil, stir, fry, deep fry
 - iii. Decrease in the nutrition of the food itself:
Refining processing, greenhouses, genetic modification, environmental pollution

Are you experiencing Metabolic Syndrome?

How to prevent or improve metabolic syndrome

REGULAR PHYSICAL EXAMINATION

BALANCED NUTRITION

AIMING FOR A HEALTHY WEIGHT

MANAGING STRESS

PHYSICAL ACTIVITY

QUIT SMOKING/LIMIT ALCOHOL CONSUMPTION

Metabolic Syndrome

1. (Customer' s name) are you experiencing metabolic risk factors as shown?
 - a. Visceral obesity
(waist circumference > 32 inches for female; > 36 inches for male)
 - b. High triglycerides
 - c. Low HDL cholesterol
 - d. High blood sugar
 - e. High blood pressure
2. If you have at least three metabolic risk factors you are likely to have metabolic syndrome.
3. Metabolic syndrome is closely linked to overweight and obesity, inactive lifestyle, and insulin resistance (less sensitive towards insulin).
4. The complications that may result from metabolic syndrome are usually serious and long-term (chronic). They include:
 - a. Hardening of the arteries (atherosclerosis)
 - b. Type II diabetes
 - c. Heart attack
 - d. Kidney disease
 - e. Stroke
 - f. Non-alcoholic fatty liver disease
 - g. Peripheral artery disease
 - h. Cardiovascular disease
5. Good news is, they are reversible through:
 - a. **Regular physical examination:** annual body checkup
 - b. **Balanced nutrition:** heart-healthy diet
 - c. **Aiming for a healthy weight:** reduce visceral fats
 - d. **Managing stress:** talk to professionals, meditation, relaxation, peer support
 - e. **Physical activity:** 150 minutes of moderate-intensity aerobic activity (30 minutes daily for 5 times a week)
 - f. **Quit smoking and limit alcohol consumption**

20 Sugar

The hidden sugar in our cool drinks

BRAND	TEASPOONS OF SUGAR PER 320ML	CALORIES	TOTAL SUGAR (G)	ADDED SUGAR	NATURALLY OCCURRING SUGAR
CLASSIC SODA	 8	140	39	High Fructose Corn Syrup	-
ZERO/DIET SODA	0	0	0	Aspartame Acesulfame	-
SODA LITE	 5	90	24	Cane Sugar Stevia	-
3 IN 1 COFFEE	 3	90	14.6	Glucose Syrup	-
BROWN SUGAR BOBA MILK TEA	 12	200-400	59.2	Brown Sugar	-
PLAIN WATER	0	0	0	-	-
ALOE CONCENTRATE MIX	0	0	0	Sucralose	-
LEMON(1 FULL SIZE LEMON)	 0.5	29	2.5	-	Fructose

Recommended total daily intake of added sugar:
< 50g (< 10 teaspoons)

"Low in sugar"

• Food products with a sugar content of < 5 grams per 100 grams of food

"Sugar free"

• Food products with a sugar content of < 0.5 grams per 100 grams of food

Tips : Sugar content is not equivalent to GI.

6 smart ways to reduce your sugar intake:

**SWITCH
DRINKS TO**

**LIMIT
SUGAR IN
BEVERAGE**

**AVOID
SUGAR IN
COOKING**

**SWITCH
DESSERTS
TO FRUITS**

**OPT FOR
"LOW
SUGAR" /
"SUGAR
FREE"**

Every day we consume more sugar than we think

Sugar

1. (Customer' s Name), which of the following beverages do you usually drink? Do you know how much sugar they contain?
2. Sugar-sweetened beverages like soda drinks are the #1 SOURCE of added sugars in our diet.
3. Sugar is a simple carbohydrate that provides instant energy and is easily absorbed by the body.
4. There are two main types of sugars:
 - (i) Naturally occurring sugars are found naturally in food such as fruit (fructose) & milk (lactose).
 - (ii) Added sugars are sugars added into food during preparation or processing.
5. If the product contains fruit or milk, the total sugar per serving listed on the label will include added & naturally occurring sugars. For products without fruit or milk content, all sugar in the food are from added sugars.
6. Intake of additional sugar is unnecessary as it can be obtained from carbohydrate-rich food.
7. Excess sugar intake contributes to extra calories. Prolonged intake of excess sugar on daily basis can lead to weight gain, resulting in overweight and obesity which are risk factors for diabetes.
8. Sugar-containing food in their natural form, whole fruit, for example, tend to be highly nutritious—nutrient-dense, high in fibre, and low in glycaemic index(GI).
9. 6 smart ways to reduce your sugar intake:
 - Switch sweetened beverages to plain water (flavour with lemon slice /aloe concentrate mix)
 - Limit added sugar intake to 1 teaspoon for each cup of beverage.
 - Avoid adding sugar into your cooking (when baking cakes/ making desserts)
 - Avoid consuming sugary food and beverages in between your main meals and before bed time.
 - Eat fruits for dessert instead of cakes and sweetened snacks.
 - Read labels and choose products labelled with “low in sugar” and “sugar free” .
