Cut Calories, Not Food

1. In order to lose weight, we must reduce calorie intake by choosing low calorie food but not diminishing our food intake nor skipping meals.
2. What is your magic number? (1XXX) What does magic number means? Magic number is the total amount of calories you have to consume each day to achieve weight loss/gain.
3. Your total metabolism rate (TMR) is 1XXX.
If you consume **more calories than your TMR** per day, the excess calories will be **stored in your body as fat**.
If the amount of calories you consume per day is **equivalent to your TMR**, you will be able to **maintain your weight**.
If the amount of calories you consume per day is **less than your TMR**, your body fat will be burned off and your **weight will be reduced**.
4. If you want to slim down effectively, your magic number can be calculated by using the formula, $TMR - 500kcal$.
5. For every **7700kcal** you lose, your weight will drop by **1kg**.
If you want to gain weight, you will gain 1kg for every 7700kcal gained.
6. All food contain calories including milk, drinks, rice, bread, biscuits, snacks, fast food, pastries, roti canai, pasta, fried noodles, nasi lemak and mamak mee goreng.
7. Eating high-calorie meals three times a day, paired with sugar-sweetened beverages or alcohol, can easily lead to excess calories.
All beverages have calories except that water is 0kcal.
8. **Remember to cut calories, not food.**

**DIZZINESS****HEADACHE****CONSTIPATION****DIARRHEA****NAUSEA****SKIN
RASH****PALPITATION**

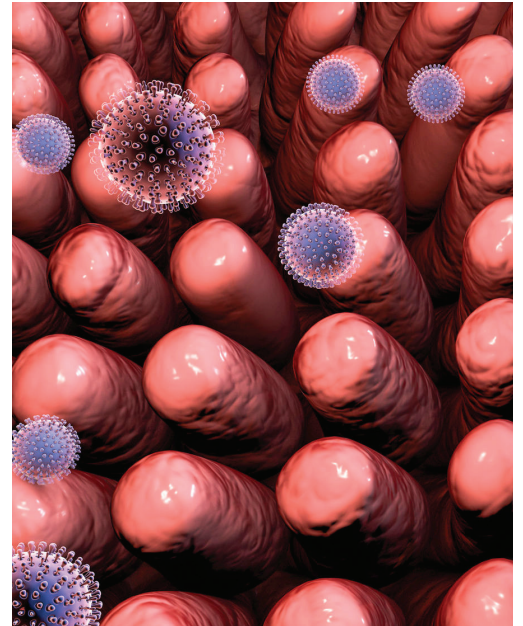

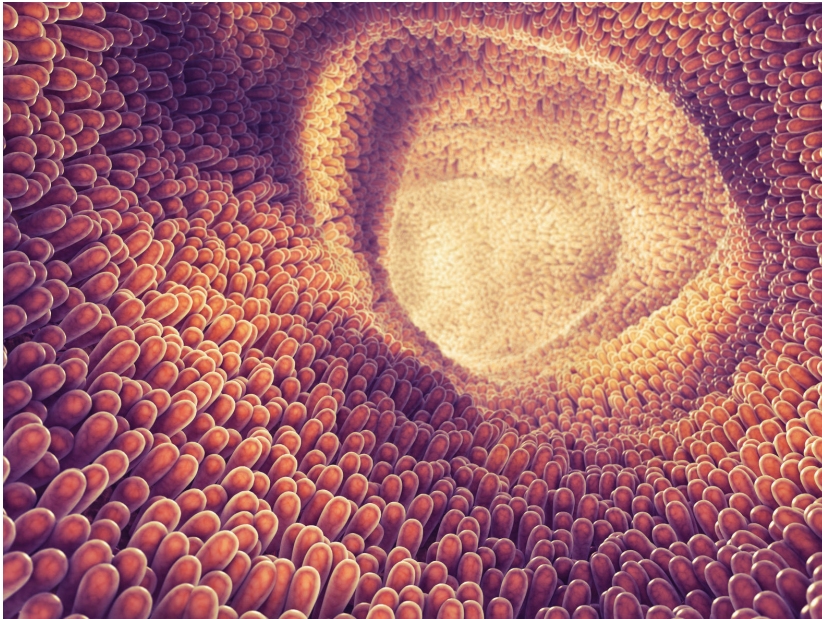

**You need to drink
more water**

Importance of Drinking Water

1. (Customer Name), how much water have you drank today?
2. About 70% of our human tissue is made up of water. Brain 75% blood 83% lymph 94%. . .
3. **We need to drink at least 3 to 4 liters of water a day**, as our body needs a lot of water. Adequate water can help deliver nutrients to cells throughout the body, while effectively expelling toxins from the body and improving metabolism. Exceptions are made to those specific individuals who are advised by medical doctor to restrict their water intake.
4. Out of 100 people, only 5 people will experience the following when improving body shape and ingesting nutrients: dizziness, nausea, headache, rash, shivering, diarrhea, constipation, etc. This may be the body's improvement in detoxification and repair. The reaction goes away when a lot of water flushes the toxin out of your body, don't worry, please let me know if you have these reactions.

DREAMWORK FAMILY

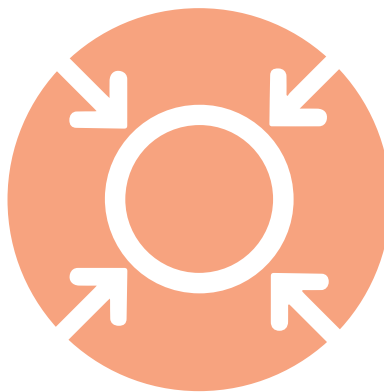

Unhealthy lifestyle will damage your villi. It will affect your body's absorption capability and become more vulnerable to germs intrusion.

**CLEAN
THE CELLS**

**ENHANCE
ABSORPTION**

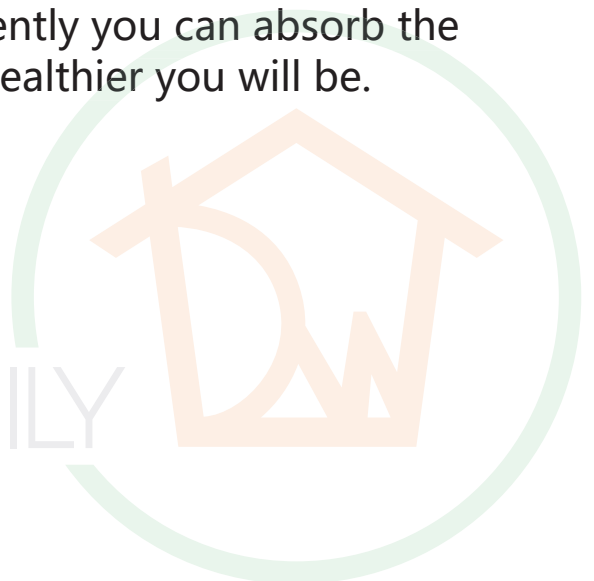

**IMPROVE CELLS'
REGENERATION**

**Provide cells with the highest
quality of nutrition.**

Cellular Nutrition

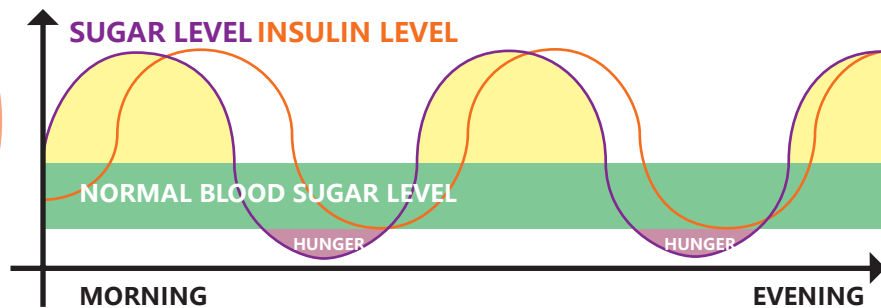

1. **Our nutritious breakfast provides exactly what your body needs: Cellular Nutrition.**
2. The small intestine carries out most of the digestive process. In our small intestine we have villi where almost all of the nutrients you get from foods are absorbed into our bloodstream.
3. When the villi are damaged or inflamed, they are unable to absorb nutrients, leading to malabsorption. Hence, nutritional deficiencies may occur.
4. Factors that affect villi are:
 - Foods containing: Trans Fat, Refined Sugar, Starch, High Salt, Preservatives, Chemical Additives, etc
 - Lifestyle and environmental factors: Pollution, Stress, Smoking, Alcohol, etc
5. Our nutritious breakfast provides cells with the highest quality of nutrition:
 - clean the cells
 - enhance absorption
 - improve cells' regeneration
6. The healthier your villi, the more efficiently you can absorb the nourishment your cells need and the healthier you will be.

DREAMWORK FAMILY

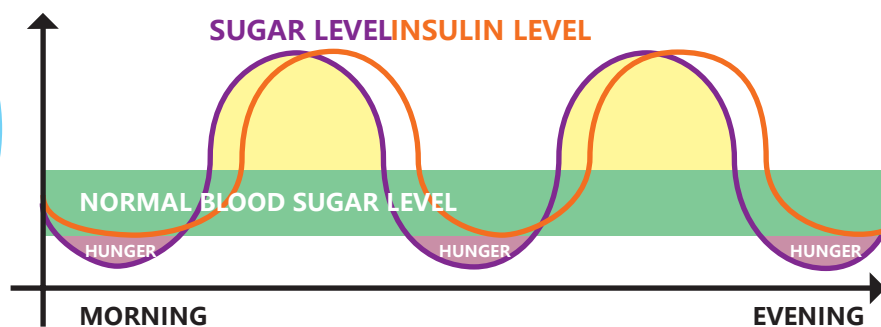

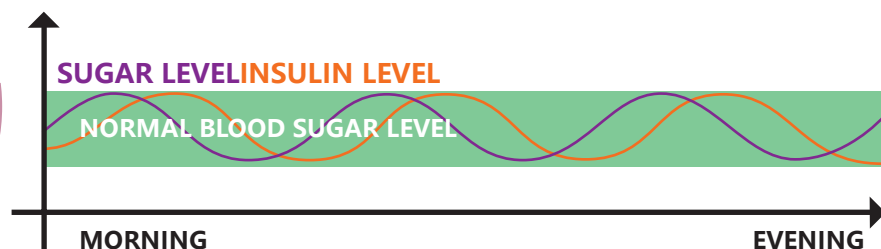

CARBOHYDRATE-BASED BREAKFAST

SKIP BREAKFAST

BALANCED AND PROTEIN-BASED BREAKFAST

**Protein-based breakfast
is very important**

Ideal Healthy Breakfast

1. After eating carbohydrate-based foods, they are converted into sugar (glucose) in the body, which provides energy throughout the body.

If we eat a carbohydrate-based breakfast (for example: cereals, bread, sandwiches, rice, porridge, noodles, etc.), blood sugar level will spike. After glucose has entered the blood and body will start to secrete insulin to return the blood sugar level back to normal.

As glucose stimulates insulin secretion, hence when we consume more refined carbohydrates, excess insulin is secreted. Since insulin is the hormone that stimulates fat accumulation, thus, it becomes easier for fat to accumulate in our body.

2. When we wake up in the morning, our blood sugar will be lower than normal, so we will usually feel hungry and lethargic. Therefore, skipping breakfast will lead to low blood sugar levels, and we will crave for carbohydrates and high calorie food to satisfy our hunger. When we eat simple carbohydrates, our blood sugar levels spike and our body will secrete extra insulin to lower blood sugar levels, causing blood sugar to drop rapidly, again increasing our sugar cravings. As what happens in the graph above, repeated cycles of high and low occur.

3. Protein-based balanced breakfast can help us to:
 - a. Restore energy consumed during the past night and replenish elements that are used to make cells overnight
 - b. Replenish water loss
 - c. Maintain normal blood sugar levels and prevent the body from secreting large amount of insulin
 - d. Maintain muscle mass

A balanced protein-based breakfast is an ideal breakfast that provides us with plenty of nutrients and energy without causing our blood sugar levels to spike.

Low GI food is the better option

Glycemic Index (GI)

1. The rate at which carbohydrate in food is digested and absorbed into the blood affecting blood sugar level = glycemic index.
2. Water has the lowest GI score which is 0 where as white sugar has the highest GI score which is 100., GI is divided into three levels: high, medium and low. (refer to chart)
3. Carbohydrates that break down quickly during digestion have a higher glycaemic index. These high GI carbohydrates release their glucose into the blood quickly. Foods high in refined carbs and sugar often have a high GI. (refer to chart)
4. Carbohydrates that break down slowly release glucose gradually into the bloodstream. They have low glycaemic indexes. The blood glucose response is slower and flatter. Low GI foods prolong digestion due to their slow breakdown and may help with feeling full. Foods high in protein, fat, or fiber typically have a low GI. (refer to chart)
5. Other factors that affect food GI include maturity and cooking method, whether you cook food such as pasta or rice. The longer they are, the more digestible their starch content is, and therefore the higher the maturity may also affect the GI of certain fruits, including bananas, which have higher GI in ripe bananas.
6. **Low GI foods are better choices, a low GI diet helps control blood sugar levels, lose weight and lower cholesterol.**

Work with coach to enhance proper eating concept.

Importance of Healthy Fat Loss and Coaching

1. If we adopt a wrong weight loss method, we will not be able to cut fat. With the guidance of the coach, you will have the correct concept to lose weight and not rebound.
2. Our body weight is affected by the changes of muscle, fats, and water components.
3. If we use the wrong way to lose weight, such as eating less and exercising more, taking diet pills, going to a slimming centre and others, we will experience muscle loss, and this leads to poor metabolism.
4. When we resume our usual eating habits, body fat will increase rapidly as our metabolism slows down due to muscle lost, hence causing our weight to rebound.
5. The correct method is **based on balance nutrition with adequate protein intake**. This will maintain or even increase our muscles mass while losing weight. As a result, metabolic rate will be raised to burn more fat and rebound will not happen after losing weight.
6. The basic protein needed for a day (body weight x 1.2~1.5)

Good fats also contain calories.

Good Fats and Bad Fats

1. **Fat is one of the important macronutrients in human body, can be classified into good fat and bad fat.**
2. **Good fats: Omega-3 and Omega-6 are essential dietary fats that cannot be produced by our body, hence we must consume them through food intake.**

Good sources of fats:

Omega-6 fatty acids: Sunflower oil, corn oil, soybean oil, sunflower seeds, walnuts, pumpkin seeds

Omega-3 fatty acids: Oily fish such as salmon, herring, mackerel, and sardines; fish oils and flaxseed oils; flaxseeds, walnuts, and chia seeds

The three most common types of Omega-3 are EPA, DHA and ALA, which serve important cellular functions such as:

- Improving heart health.
- Supporting mental health.
- Reducing weight and waist size.
- Decreasing liver fat.
- Supporting infant brain development.
- Anti-inflammation.

Omega-6 fats, which we get mainly from vegetable oils, are also beneficial. They lower harmful LDL cholesterol and boost protective HDL. They help keep blood sugar in check by improving the body's sensitivity to insulin; but too much Omega-6 intake (compared with Omega-3) may contribute to inflammation and chronic diseases, such as rheumatoid arthritis, diabetes, atherosclerosis, and heart failure.

3. The other two types of bad fats — saturated fat and trans-fat — have been identified as potentially harmful to our health because they increase our body's production of cholesterol that cause clogging of our blood vessels, or atherosclerosis.
 - Saturated fats: Most of the foods that contain these types of fats are solid at room temperature, such as butter, margarine, shortening, beef, or pork fat
 - Trans fats: Created by a chemical process that turns liquid vegetable oils into semi-solid or solid fats at room temperatures
4. Trans fat should be avoided while saturated fats should be eaten very sparingly.

Build healthy lifestyle**

Reading Food Label

1. Do you read the nutrition label when you buy packaged food?
2. Based on these two labels shown here:
 - a. First, choose those with the lowest calorie.
 - b. If both contain the same number of calories, choose the one with the highest amount of protein.
 - c. If the protein content is the same for both products, choose the one with the lowest amount of fat.
 - d. This sequence will allow you to make the best choice of food product.
3. What do you concern most when you are buying packaged food?
 - a. The taste?
 - b. The price?
 - c. Nutrition facts?

Be a smart shopper, opt for higher nutritional value food with the same amount of expenses, to keep your body healthy.

Don't eat more just because of exercise.

Benefits of Exercise

1. (Customer Name), are you used to exercise? A healthy active lifestyle means that is 80% nutrition and 20% exercise. We recommend a minimum of 30 minutes exercise, 3 times a week with sweating and panting during exercise.
2. Exercise can burn calories.
Calories burned in different types of activities:
 - Our body burn calories at all times, such as sleeping, sitting, eating, standing, driving etc, it will burn approximately 50-150 calories.
 - When the amount of activity increases, such as walking, brisk walking, playing golf, yoga, light exercise etc will burn about 150-300 calories per hour.
 - Exercise can help to burn off calories such as mountain climbing, badminton, gymnastics, cycling, weight lifting etc can burn about 300-500 calories.
 - Vigorous sports such as basketball, dancing, swimming, running, etc can burn more than 500 calories per hour.
3. The benefits of exercise:
 - May improve health conditions and diseases. (being active boosts high-density lipoprotein (HDL) cholesterol, the "good" cholesterol, and it decreases unhealthy triglycerides.)
 - Can improve mood (Physical activity stimulates various brain chemicals that may leave you feeling happier, more relaxed and less anxious.)
 - Can boost energy (Exercise delivers oxygen and nutrients to your tissues and helps your cardiovascular system work more efficiently. And when your heart and lung health improve, you have more energy to tackle daily chores.)
 - Can promote better sleep (Regular physical activity can help you fall asleep faster, get better sleep and deepen your sleep)
 - Can speed up our metabolism and it is beneficial for a healthy weight loss.
4. **However, you cannot eat more just because you have done exercise, and your food consumption is beyond the calories you had burned.**
